### MERCURY

**Planetary Order:** 1\textsuperscript{st} planet from the sun

**Planet Size:** 4,880 Kilometers

**Rotation Time (Earth Days):** 59

**Orbit Time (Earth Years):** .241

**Orbit Time (Earth Days):** 88

---

How much would you weigh on this planet if you weighed 100 pounds on Earth? 38 lbs

**Distance from the Sun (1AU = 150,000,000km)**

- AU’s: .4
- Kilometers: 60 million

**Number of Moons:** None

**Major Moons:** None

**Planet named for:** Roman god of speed

**Mean Temperature:** -183°/427°C

**Surface Description:**
Mercury is covered with craters. It looks like our moon. There is no water. It has cliffs and valleys.

**Cool Facts:**
- Mercury is an extreme planet: smallest, densest, oldest surface
- Least explored
- The temperature can change more than 1,000°F/530°C between night and day
- Mercury travels around the sun 167,400kph/104,000mph

**How much would you weigh on this planet if you weighed 100 pounds on Earth?**  
91 lbs

**Distance from the Sun (1AU = 150,000,000km)**  
AU’s: .7  
Kilometers: 108 million

**Number of Moons:** None  
**Major Moons:** None

**Planet named for:** Roman goddess of love and beauty

**Mean Temperature:** 457°/482°C

**Surface Description:**  
Venus has no ocean. It’s covered by thick, rapidly spinning clouds. The surface is hot, poisonous, and mostly made up of carbon dioxide.

**Cool Facts:**  
- The greenhouse effect is out of control. It can get up to almost 900°F (482°C)  
- The atmosphere is so heavy, it feels like you are deep in the ocean  
- Venus spins backwards, so the sun rises in the west and sets in the east  
- A school day would last 4 months on Venus

How much would you weigh on this planet if you weighed 100 pounds on Earth?  100 lbs

Distance from the Sun (1AU = 150,000,000km)  
AU’s: 1  Kilometers: 150 million

Number of Moons: 1  Major Moons: Moon

Planet named for: The Earth has hundreds of different names in different languages

Mean Temperature: 150°C/20°C

Surface Description:  
Most of our planet is covered with water. Air, water, land and life combine forces to create a constantly changing world.

Cool Facts:  
- The fifth largest planet in our solar system  
- Earth has one moon. It’s the brightest and most familiar object in our night sky  
- The four seasons are a result of Earth’s axis of rotation being tilted more than 23°  
- The only planet that has liquid water on the surface

**How much would you weigh on this planet if you weighed 100 pounds on Earth?** 38 lbs

**Distance from the Sun (1AU = 150,000,000km)**
- AU’s: 1.5
- Kilometers: 228

**Number of Moons:** 2  
**Major Moons:** Phobos and Deimos

**Planet named for:** Roman god of war

**Mean Temperature:** -87°C/-5°C

**Surface Description:**
A small rocky body thought to be very Earth-like. Dust storms create giant dunes, wind streaks and wind-carved features.

**Cool Facts:**
- Mars, like Earth, has polar ice caps, volcanoes, canyons and four seasons
- Olympus Mons is the big volcano - 4x bigger than any on Earth
- Periodically, great dust storms engulf the entire planet
- Known as the red planet
- One of the brightest objects in the sky

How much would you weigh on this planet if you weighed 100 pounds on Earth? 236 lbs

Distance from the Sun (1AU = 150,000,000km)
- AU’s: 5.2
- Kilometers: 778 million

Number of Moons: 63
Major Moons: Callisto, Europa, Io and Ganymede (Ganymede is the largest moon in our solar system)

Planet named for: The King of Roman gods

Mean Temperature: -150°

Surface Description:
The planet with the big red spot, Jupiter is a giant ball of gas and liquid with little, if any solid surface. Instead, the planet’s surface is composed of dense red, brown, yellow, and white clouds.

Cool Facts:
- The four largest moons were discovered by Galileo Galilei in 1610
- Jupiter has three rings, but very hard to see
- Jupiter rotates faster than any other planet
- More than 1,300 Earth’s could fit in Jupiter
### SATURN

<table>
<thead>
<tr>
<th>Planetary Order: 6th planet from the sun</th>
</tr>
</thead>
<tbody>
<tr>
<td>Planet Size: 120,536 Kilometers</td>
</tr>
<tr>
<td>Rotation Time (Earth Days): .44</td>

<tr>
<td>Orbit Time (Earth Days): 10,748</td>
</tr>
</tbody>
</table>

**How much would you weigh on this planet if you weighed 100 pounds on Earth?** 91 lbs

**Distance from the Sun (1AU = 150,000,000km)**

- AU’s: 9.5
- Kilometers: 1,426,725,400

**Number of Moons:** 52  
**Major Moons:** Titan, Rhea, Iapetus, Phoebe

(Titan is the 2nd largest moon in our solar system)

**Planet named for:** Roman god of agriculture

**Mean Temperature:** -180°C

**Surface Description:**
The rings are made up of billions of particles of ice and rock. Saturn has clouds, stripes and storms like Jupiter, but they are harder to see. The clouds we see are yellow and white.

**Cool Facts:**
- The rings are believed to be pieces of comet, asteroids, or shattered moons
- The winds on Saturn are 10x faster than our hurricanes
- Saturn is the second largest in our solar system

</tbody>
</table>

- **How much would you weigh on this planet if you weighed 100 pounds on Earth?** 89 lbs

- **Distance from the Sun (1AU = 150,000,000km)**
  - AU’s: 19.2
  - Kilometers: 2.4 billion

- **Number of Moons: 27**
  - Major Moons: Oberon & Titania were discovered first, then Ariel and Umbriel.

- **Planet named for:** A Roman god who was father of the Titans

- **Mean Temperature:** -197°C

- **Surface Description:**
  - It has no solid surface. Uranus gets its blue, green color from methane gas.

- **Cool Facts:**
  - Uranus’ moons are unique in being named for Shakespearean characters, along with a couple from the works of Alexander Pope
  - First planet found with the aid of a telescope in 1781
  - A spacecraft would be crushed in its clouds
  - Seasons last more than 20 years because it’s tilted on its side
### Neptunne Trading Card

| **Planetary Order:** 8th planet from the sun |
| **Planet Size:** 49,532 Kilometers |
| **Rotation Time (Earth Days):** .67 |
| **Orbit Time (Earth Years):** 163.72 |
| **Orbit Time (Earth Days):** 60,189 |

**How much would you weigh on this planet if you weighed 100 pounds on Earth?** 110 lbs

**Distance from the Sun (1AU = 150,000,000km)**
- **AU’s:** 30.1
- **Kilometers:** 4.5 billion

**Number of Moons:** 13  
**Major Moons:** Triton  
(which rotates in the opposite direction of the planet)

**Planet named for:** The Roman god of the sea

**Mean Temperature:** -200°C

**Surface Description:**
Neptune gets its blue color from a layer of methane gas above the clouds. Methane absorbs red light, so only blue shows up when we look at it.

**Cool Facts:**
- Crosses orbit with Pluto
- The first planet located through mathematical predictions
- The most windy planet in our solar system, 20x faster than our hurricanes
- The 4th largest planet
- In the year 2011, Neptune will complete one orbit of the sun since it was discovered in 1846
### PLUTO

<table>

<tr>
<td>Orbit Time (Earth Days): 90,465</td>
</tr>
</tbody>
</table>

**How much would you weigh on this planet if you weighed 100 pounds on Earth?**  81 lbs

**Distance from the Sun (1AU = 150,000,000km)**
- AU’s: 39.5
- Kilometers: 5,906,380,000

**Number of Moons: 3**
- Major Moons: Charon, Hydra, Nix

**Planet named for:** Roman god of the underworld

**Mean Temperature:** -233°C

**Surface Description:**
We can only guess what Pluto’s surface looks like. It is so far away, even powerful telescope pictures are fuzzy. It’s probably covered with frost.

**Cool Facts:**
- From Pluto, our sun would look like a very bright star
- There is no air to breathe
- Pluto has a very large moon named Charon
- It takes two hours for light to reach Pluto
- Pluto is now called a “dwarf” planet
