## STORM Team

 Mission Day Instructions
## Overview

Solar weather impacts the space station in much the same way as our weather impacts the earth. The difference is that solar weather can include XRays and protons from the sun. Solar proton events are dangerous and can cause great harm to the astronauts and damage the space station.

You will monitor X-Ray production, which provides an indicator of a possible Solar Proton Event.

X-Ray and proton data comes from the GOES-8 (Geostationary Orbiting Environmental Satellite-8). Your team is responsible for graphing the data and making calculations. Predict the strength of the storm as well as how long it might last. Make recommendations to the other teams to protect the space station and the crew.

## Missions Day Materials

- One computer for real-time data
- Life Support Reference Guide
- Mission Day Materials (one per team member):
- Mission Day Instructions
- Storm Data Graphs and Instructions
- Storm Data Tracking Tables
- Print and cut 7 copies of Blank Report Forms on colored paper to deliver to the Communications Team
- Rulers for plotting data on graphs
- Calculators

## Your Task

By the time the mission starts, the Storm Team should be able to:

- Analyze real-time data, record it, graph it, and make calculations.
- Monitor solar activity, provide regular space weather reports and alert all teams and Mission Control of any noteworthy fluctuations.
- Use the STORM Team Reference Guide to understand X-Ray productions and SPEs and their potential impact on the space station as well as the earth.

## Team Tasks

These tasks are listed in priority order. Next to each task, assign a team member. Depending on the size of your team, you may need to assign two tasks to one person.

Crisis Management: Makes sure all data is analyzed every five minutes. Determines priority level, whether there are any concerns, and helps team decide on any recommendations.

Data Graphing: Records real-time data on graphs and predicts which way the trend is moving. Uses ruler to make predictions. May be combined with Data Analysis tasks.
Data Analysis (X-Rays): Records real-time data in Data Tracking Tables and conducts analyses. Completes Report Forms about every five minutes or as needed.

Data Analysis (Protons): Records real-time data in Data Tracking Tables and conducts analyses. Completes Report Forms about every five minutes or as needed.
Crisis Management Helper/Data Runner: Gathers report forms every five to six minutes. Prioritizes any urgent recommendations. Writes down all questions from Mission Control and responds with written notes given to the Comm Data Officer. This may be combined with Crises Management Tasks.

Data Recording: Records real-time data from the computer. The data will be accessed and downloaded after the start of the mission. May be combined with other tasks.
(optional) Research and Reference: Reads and understands information provided in the Reference Guide to make recommendations to Mission Control. May be combined with other tasks above.
(optional) Reporter/Graphic Organizer: Takes notes during the mission like a reporter from a newspaper. Writes down all the emergencies, options, choices, and successes. May want to use a "graphic organizer" like a white board or chalkboard posted on the wall that is visible to all teams.

## STORM Team

## Graphs and Instructions

## Instructions for Graphing the Data

The STORM Team will be responsible for creating two graphs. Use the data from Column B on each Data Tracking Table for the yaxis values and plot them along the x -axis according to the correct UTC time.

## STORM Team

## Graphs and Instructions

You will receive real-time data about every five minutes from the GOES-8 Satellite in orbit between the Earth and the Sun. The data includes X-Ray and proton production from the sun. your team should be able to analyze this data quickly. It is strongly
recommended that you complete the practice worksheets and practice graphs before mission day. Use the instructions below and the attached Data Tracking Table. Note: Since we are working with large numbers here, there is no need to use decimals - round to the nearest whole number.

First, find the two worksheets labeled STORM Team Data Tracking Table: (One is for X-Rays and the other for Protons)

Column A: Coordinated Universal Time (UTC) UTC is a universal standard in which time is given on a 24-hour clock with no "am" or "pm." For example, on o'clock is 01:00. Four-twenty in the afternoon is 16:20. Eleven-fifteen at night is 23:15.

| Column | A | $\begin{gathered} \mathbf{B} \\ \text { (Graplit the column) } \end{gathered}$ | C | D | E | F | G |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Table <br> Heading | UTC | X-Rays | Categry | Change | Rate | Projected X-Ray <br> Productionin 1 Hour | Canegry |
| Unit | 24 Hour Clock | Amount of X-Rays | $\begin{gathered} \text { From } \\ \text { R1 to R5 } \end{gathered}$ | Amount of X-Rays | X-Rays/min | X-Ray Production | From R1 to R5 |
| alculations | From Data | From Data | See Reference Guide | B - Previous B | D/20 min | (E×60 min $)+\mathrm{B}$ | See Reference |
| ${\underset{\sim}{y}}_{\underset{\sim}{y}}^{0}$ | 15:00 | 9 | R1-R2-R3-R4-R5 | n/a | n/a | $\mathrm{n} / \mathrm{a}$ | R1-R2 2 R3-R |
|  | 15:20 | 16 | R1-R2-R3-R4-R5 | 7 | 0 | 37 | $\mathrm{RI} \cdot \mathrm{R} 2 \cdot \mathrm{R} 3 \cdot \mathrm{R}$ |
|  | 15:40 | 46 | R1-R2-R3-R4-R5 | 30 | 2 | 136 | $\mathrm{RI} \cdot \mathrm{R} 2 \cdot \mathrm{R} 3 \cdot \mathrm{R}$ |
|  | 16:00 | 1250 | R1-R2-R3-R4-R5 | 1204 | 60 | 4862 | $\mathrm{RI} \cdot \mathrm{R} 2 \cdot \mathrm{R} 3 \cdot \mathrm{R}$ |

Column B: Real-Time Data
Record the real-time data in Column B. You will also need to plot this data on a graph.

With X-Rays, energy is measured in microwatts, which is $1 / 1000$ of a watt. A nightlight is about 5 watts. With protons, the unit of measure is the number of protons hitting the measuring device on the satellite. Protons of an energy level exceeding 10 MeV (mega electron volts) are counted.

## Column C: Category

Take the data from Column B and determine where that number falls in the ranges given in the Table 1 below.
Table 1

| X-Ray <br> Amount <br> (microwatts) | X-Ray <br> Category | Descriptor |
| :---: | :---: | :---: |
| $0-50$ | R1 | Minor |
| $50-100$ | R2 | Moderate |
| $100-1000$ | R3 | Strong |
| $1000-2000$ | R4 | Severe |
| $>2000$ | R5 | Extreme |

| Proton <br> Production | Proton <br> Production <br> Category | Descriptor |
| :---: | :---: | :---: |
| $10-99$ | S1 | Minor |
| $100-999$ | S2 | Moderate |
| $1000-9999$ | S3 | Strong |
| $10,000-99,999$ | S4 | Severe |
| $1000,000+$ | S5 | Extreme |
|  |  |  |

## Column D: Change

Calculate the change in X-Rays or protons since the last reading. Start with the current reading in Column $B$ and subtract the previous reading from above.

Column E: Rate
Column $E$ is for the rate of production per minute. It answers the question, "How many X-Rays or protons are being received each minute?" To calculate this number, use the number in Column D and divide by the number of minutes since the last reading.

## Column F: Projection

X-Ray: For X-Rays, you are making a 1-hour projection. Use the rate you calculated in Column E and multiply it by 60 minutes, then add it to column $B$.

Proton: For Protons, you are making a 23-hour projection. Use the rate you calculated in Column F and multiply by 1440 minutes.

## X-Ray:

You are making a 1-hour projection to determine if a CME or SPE will be forthcoming.

For example, if the hourly X-Ray production for UTC 16:40 is 14 microwatts per minute, then you would expect the rate to jump to 840 microwatts per minute one hour from now $(14 * 60=840)$.

## Proton:

You are making a 24 -hour projection to determine how large the storm may grow and how long it may last.

For example, if the hourly proton production for UTC 16:45 is 0.12 protons per minute, then you would expect the rate to jump to 173 protons per minute 24 hours from now $(0.12 * 1440=173)$.
Note: If your answer is a negative number, use Zero (because the sun cannot produce negative amounts of protons or x-rays). A zero in the Projected Production indicates that there is a current decrease in production that will go to zero in a 24 hour period if this rate of decrease continues.

You may want to refer to the tables given in the Space Weather Reference Guide about X-Ray and Solar Radiation Storm impacts on radio and navigation systems to decide if there are any effects to discuss with Mission Control.
