

Humidity Team Relative Humidity - Day 2

Important: Complete this map *before* starting the dew point temperature map.

Relative humidity measures how close air is to saturation. The possibility of precipitation *increases* as the relative humidity approaches 100 percent. Use a red pencil to circle numbers greater than or equal to 90 (≥ 90). DO NOT shade in the circle. Now look at the areas you circled. Which have the highest *possibility* of precipitation?

Compare the days 1 and 2 maps. The star marks New York City. Do you notice any weather patterns or trends that would affect the weather in New York City in 24 hours? In 48 hours?
